

## **Statement**

### **Rapid diagnostic test for detection of 2019-nCoV antibodies in blood**

The rapid diagnostic test for the qualitative detection of IgG / IgM antibodies in whole blood from a finger is intended only for professional diagnostics.

It is recommended to do the test on the 7th day after contact with an infected person or when the patient has symptoms manifesting in cough, shortness of breath and fever.

This test should not be taken as the sole criterion for the diagnosis of 2019-nCoV infection.

As with all diagnostic tests, the test results should be considered in conjunction with other information about the patient's state of health.

If the test shows a negative result, while the examined person shows other symptoms of 2019-nCoV infection, it is recommended to consult a doctor by phone. A negative result does not exclude the possibility of coronavirus infection.

**Positive and negative results should be consulted with a physician!**

#### Declaration

I, the undersigned, declare that I have read the information regarding the quick test and the content of the instructions for using the service and accept all its points.
